

LOGISTICS MULTI-AGENT SHOWCASE

A familiar logistics job, enhanced by agents

A business-first view of selected responsibilities, existing systems, and governed automation.

Work in progress · minimum-viable showcase

START WITH THE BUSINESS

Meet the Transport Planner

The planner understands the customer's promise, compares credible options, and owns the operational decision.

Planner

Understands requirements and service commitments.

Company systems

TMS, rate management, quotation, and other systems each hold part of the truth.

Commercial team

Reviews decisions that change the company's commitment.

THE INTERRUPTION

A quote is no longer reliable

Shanghai → Munich. An exchange rate moves, a route loses capacity, or a carrier option changes.

The planner needs options, evidence, and a clear approval boundary—not a mysterious all-knowing answer.

THE ENHANCEMENT

Selected responsibilities become agent capabilities

A2A connects specialist agents. MCP gives them controlled access to existing enterprise capabilities.

The systems of record remain

TMS

Route and transport-capacity facts.

Rate system

Carrier-rate facts.

Quotation system

Quote and approval state.

Agents change how people interact with the landscape—not where business truth is owned.

GOVERNED AUTONOMY

Human-in-the-loop is explicit

The agent may prepare a route deviation. It may not approve it. The policy engine and control-panel enforcement point keep that boundary visible.

THE CENTRAL MESSAGE

Business responsibility stays visible

Systems of record remain. Selected responsibilities become agent capabilities. A2A connects capabilities. MCP connects them to enterprise systems. Policy keeps every meaningful action governed.

More soon.
