

ONBOARDING STORY · LOGISTICS SHOWCASE

# Transport Planner — an agentically enhanced job

Selected responsibilities become governed agent capabilities while the job, accountability, and systems of record remain.

CHAPTER 1 · THE ROLE

# Meet the Transport Planner

Press ↓ to meet the role and its working context.

## THE JOB

### **Plan and route**

Create executable routes that fit time, traffic, equipment, and customer requirements.

### **Compare choices**

Find suitable cost and transport-mode options.

### **Stay accountable**

Monitor execution, communicate, and adjust when conditions change.

The company selects only a few responsibilities for software support.

## THE HUMAN STRUCTURE

# The planner works in a team

The manager, pricing colleagues, approval limit, and escalation path are business context—not agent architecture.

## CHAPTER 2 · THE INTERRUPTION

# A business interruption occurs

Press ↓ to see why the planner must reassess an existing commitment.

# The Shanghai–Munich quote may no longer hold

An exchange rate moves. A route loses capacity. An operating condition changes.

The team needs credible alternatives, evidence, and a clear indication of where approval is required.

## CHAPTER 3 · HUMAN BASELINE

# How the planner performs the work here

The reference process comes before the agent variation.

The planner owns the understanding, judgment, communication, and escalation.

# The baseline ends with a human decision

CHAPTER 4 · AGENT-SUPPORTED VARIATION

# Specialists support selected steps

Press ↓ to see the agent roles and their controlled boundaries.

Commercial Normalization Agent makes route costs comparable across modes, currencies, and carrier inputs.

# Agents do not own the truth

## **TMS**

Routes and transport capacity.

## **Rate system**

Carrier-rate facts.

## **Quotation system**

Quote and approval state.

MCP sits over existing APIs. Agents change interaction and orchestration, not ownership of truth.

# Business hand-offs, governed access

## **A2A**

Lane Evaluation Agent asks Route Decision Agent to prepare a recommendation.

## **MCP**

Agents use controlled company services to access TMS and rate capabilities.

## **Policy engine**

Each requested action is checked before it can affect a company system.

## CHAPTER 5 · GOVERNANCE

# The agent prepares. People approve.

Press ↓ to follow the human-in-the-loop boundary.

Route-deviation approval is prohibited for the route agents. The accountable human decision remains visible.

# What remains with the Transport Planner

- Decide how recommendations fit customer commitments and priorities.
- Validate whether a recommendation is realistic.
- Monitor execution and communicate with carriers, drivers, customers, and colleagues.
- Handle exceptions and accept, revise, or escalate a recommendation.

The agent is a bounded colleague for selected analytical and preparatory work—not a replacement for the complete job.

CENTRAL MESSAGE

# **Business responsibility stays visible**

Systems of record remain. Selected human responsibilities become agent capabilities. A2A connects those capabilities. MCP connects them to enterprise systems. Policy keeps every meaningful action governed.
